

Digital Medico

A connected medical history, medication schedule and care team.

The right history.
At the right time.

Two portals connect patients and doctors through a shared, permission-controlled backend.

PATIENT + DOCTOR

PRIVACY FIRST

How the website works

One patient account connects every visit, prescription, question and access decision.

Patient consent controls the whole loop. Revoking it blocks doctor access on the server.

Technology stack: what we actually built

A lightweight, open-source stack keeps the website easy to develop, run and demonstrate.

LAYER	TECHNOLOGY	WHAT IT DOES
Frontend	React + Vite	Responsive patient and doctor portals.
Backend	Python HTTP API	Authentication, clinical workflows and access checks.
Database	SQLite	Stores records, consent, prescriptions and messages.
Reminders	Browser timers + notifications	Shows due-dose alerts while the website is open.
Security	script + secure session controls	Password hashing, HTTP-only cookies and CSRF checks.
Development	VS Code + GitHub + automated tests	Local setup, source delivery and workflow validation.

Production upgrades proposed: FastAPI, MySQL, encrypted storage and durable reminder workers.

Architecture: one backend, strict data boundaries

Every medical request passes authorization before a patient-scoped database query.

The UI cannot grant access. Unauthorized API requests are rejected, even with a known patient ID.

Three features, explained clearly

Connected history, safe communication and medication adherence.

EMERGENCY HISTORY

Find the right context

Patient ID → demo identity check
→ consent check → essential
medical history → audited access.

DOCTOC

Doctor-led guidance

Schedule questions read recorded
prescriptions. Clinical questions
go to the doctor. Urgent
symptoms receive emergency-
care guidance.

MEDICATION REMINDERS

Follow the schedule

Doctor sets dose and IST time →
website reminder → taken /
snooze / missed status → dose
activity visible to the doctor.

Prototype limits: simulated biometrics, scripted Doctoc and reminders that require an open website.

Privacy is enforced—and tested

Patient control is backed by server checks, not just interface settings.

Isolated patient accounts

One patient cannot read or update another patient's records.

Consent-controlled care

Revocation blocks doctor reads, edits and emergency access.

Protected sign-in

Hashed passwords, HTTP-only sessions and CSRF-protected writes.

Transparent access

Medical views and updates leave an audit trail.

VERIFIED: 13 API tests • both portal logins • full browser workflows • production build

Synthetic data only. Local storage is not encrypted at rest; this is not a production medical system.

A working website. A clear next step.

Demonstrate the connected care loop, then explain how it becomes production-ready.

Show the judges

- 01 Patient: question + dose confirmation
- 02 Doctor: record + prescription + reply
- 03 Patient: update appears; revoke access
- 04 Doctor: medical access is denied

NEXT: verified clinicians, encrypted storage and reliable background reminders.
